6.1 Architecture Evaluation Methods. Software architecture evaluation is the analysis of a system's capability to satisfy the most important stakeholder concerns, based on its large-scale design, or architecture (Clements et al., 2002). On the one hand, the analysis discovers potential risks and areas for improvement; on the other hand, it can raise confidence in the chosen architectural approaches.

Software Architecture Analysis Method (SAAM) It is originally designed for assessing modifiability, but later was extended for reviewing architecture with respect to quality attributes. Architecture Tradeoff Analysis Method (ATAM) It is a polished and improved version of SAAM, which reviews architectural decisions with respect to the quality attributes requirements, and how well they satisfy particular quality goals. Active Design Review (ADR)

Software architecture - Wikipedia

Partly motivated by this reasoning, a new software architecture evaluation method called DCAR was proposed in [21]. DCAR uses architectural decisions as the basic concept in the architecture evaluation. Another central concept in DCAR is a decision force—that is, any fact or viewpoint that has pushed the decision in a certain direction [31]. Forces can be requirements, or existing decisions (e.g., technology choices, previous experiences, political or economical considerations, etc.).

Software Architecture - an overview | ScienceDirect Topics

A software architecture is a set of concepts and design decisions about structure and texture of software that must be made prior to concurrent engineering (i.e., implementation) to enable effective satisfaction of architecturally significant, explicit functional and quality requirements, along with implicit requirements of the problem and the solution domains.
