Centrifugal blowers can pull vacuum on processes and produce positive pressure. Thus, economically generating dry, clean air at low pressure resulting in increased production. To create this velocity with a continuous flow of air or gas, each blower has a set of internal wheels or impellers. Air or gas is absorbed into the inlet and transferred ...

The ZM series is a centrifugal blower with oil-free compression and a variable number of stages, depending on the desired flow rate and pressure. The blower is air cooled and is designed to be used with an inverter and based on a pressure range of up to 20 psig (under pressure), -7.25 psig (in a vacuum) and a flow rate up to 32,000 psig for air ...

Choosing the right industrial pump to suit a specific application requires a choice between centrifugal and positive displacement pumps. Both types offer a number of benefits and areas of application. Choosing the wrong pump could result in process failure and a poor return on investment. Learn the differences.

A complement to the axial fan device, this is a material type that changes the flow direction from axial to radial. The user specifies a flow rate (constant or a fan curve) as well as an optional rotational speed. This device models the flow through the impeller of a centrifugal device, so the volute geometry is required. Flow can also be made to enter radially/tangentially and exit axially ...
