The successful design of a municipal WWTP is based on consideration of each unit process and the upstream and downstream effects of that unit's place and performance in the overall scheme of the treatment works. The chapters that compose Volume 1 generally cover design concepts and prin- ciples that apply to the overall WWTP.

DESIGN OF MUNICIPAL WASTEWATER TREATMENT PLANTS

Artificial or constructed wetlands have a higher degree of biological activity than most ecosystems; thus transformation of pollutants into harmless by-products or essential nutrients for plant growth can take place at a rate that is useful for the treatment of municipal wastewater (Case Study 22.1). Most artificial wetlands in the United States use reeds or bull rushes, although floating aquatic plants such as water hyacinths and duckweed have also been used.

DESIGN FACTORS Design and layout of an activated sludge plant for the treatment of municipal wastewater is based on the following design data: (a) wastewater flow (MGD) daily peak wastewater flow (1000 gal/hr) (b) average influent BOD (mg/l) (c) average influent suspended solids (mg/l) The basic data should also include any industrial waste and information re- lating to type, source of wastewater, and quantity of discharge.

Apart from the use of effluent for irrigation of crops, termed 'slow rate' land treatment in the US Environmental Protection Agency's Process Design Manual for Land Treatment of Municipal Wastewaters (EPA 1977), and 'rapid infiltration' or 'infiltration percolation' of effluent discussed as soil-aquifer treatment in a later section of this document, the EPA manual deals with 'overland flow' as a wastewater treatment method.

Wastewater treatment refers to the physical, chemical, and biological processes used to remove pollutants from wastewater before discharging it into a waterbody. Since the Clean Water Act was issued in 1972, there are now more than 16,000 publicly owned wastewater treatment plants in operation in the United States. The continual construction of new plants and the upgrading of older plants create a strong demand for highly skilled operators and designers.
