Digital electronics is a field of electronics involving the study of digital signals and the engineering of devices that use or produce them. This is in contrast to analog electronics and analog signals. Digital electronic circuits are usually made from large assemblies of logic gates, often packaged in integrated circuits. Complex devices may have simple electronic representations of Boolean logic functions.

A digital circuit is often constructed from small electronic circuits called logic gates. Each logic gate represents a function of boolean logic. A logic gate is an arrangement of electrically controlled switches. The output is an electrical flow or voltage, that can, in turn, control more logic gates. Logic gates often use the fewest number of transistors in order to reduce their size, power consumption and cost, and increase their reliability.

Digital circuits are used because they are efficient and work well, also, digital signals are easier to transmit than actual sound (for example a persons voice). The various parts of a computer communicate through the use of electronic pulses (1 s and 0 s). Consequently digital logic circuits are ideal for the internal electronics.

Digital Electronics and Logic Circuits - 1

Definition: Digital Electronics is the sub-branch of electronics which deals with digital signals for processing and controlling various systems and sub-systems. In various applications like sensors and actuators, usage of digital electronics is increasing extensively.

What is Digital Electronics? - Digital Circuits and ...

On the contrary, a Digital Circuit is also a type of an electronic circuit that is predominantly built using Digital electronic components to process digital signals. At low level, the digital circuits consist of a combination of transistors, logic gates (AND, NAND, NOT etc.) and at high level, microcontrollers and processors.

Computers do not have ten fingers so the decimal number system is not the most efficient system to use in computers. Instead, the binary system with radix 2 is used. For example, 1101 (base 2) = 1\*2<sup>0</sup> + 0\*2<sup>1</sup> + 1\*2<sup>2</sup> + 1\*2<sup>3</sup> = 13 (base 10). The rightmost digit is the least significant digit with the worth 2<sup>0</sup> = 1. We can call the least significant the 1's, the next digit from the right is the 2's.
