Therefore, a method to reliably distinguish between benign and malignant small solid pancreatic lesions would be highly desirable. We investigated the role of endoscopic ultrasound (EUS) elastography in this setting. Methods Patients with solid pancreatic lesions 15 mm in size and a definite diagnosis were included. Lesion stiffness relative to the surrounding pancreatic parenchyma, as qualitatively assessed and documented at the time of EUS elastography, was retrospectively compared ...

Endoscopic ultrasonography (EUS) and endobronchial ultrasound (EBUS) have largely replaced mediastinoscopy for this purpose. EUS is routinely performed in other settings such as esophageal cancer patients to enhance locoregional staging accuracy, partly through the use of fine-needle aspiration (FNA) for sampling malignant-appearing lymph nodes.

Endoscopic ultrasound (EUS) is the best imaging modality for further evaluation of SETs. However, it does not allow definite discrimination of benign from malignant lesions 2.3 . As larger SETs (> 3 cm) should rather primarily be resected due to their higher malignant potential, the optimal approach to smaller lesions (3 cm) remains inconclusive 4 .

CONTRAST-ENHANCED ENDOSCOPIC ULTRASOUND. Endoscopic US (EUS) has gained importance, and detailed knowledge has been published [14,15,16,17] Comparatively, little is known about the use of contrast-enhanced EUS (CE-EUS) [18,19,20,21,22] The first pilot study performed in 2003 described an experimental technique of CE-EUS based on a linear prototype EUS scope, using a low mechanical index (MI ...
