Sometimes the engine failsafe mode is triggered due to a sensor failure or an electrical glitch. It's also common for a security system fault to engage this warning light, which means it's not always a mechanical issue that's causing the failsafe. Some people believe it's possible to reset the engine failsafe mode through some less-than-reliable methods. This is not true, nor

*ENGINE FAILSAFE PROG??? please help*

Hi there. There are a few possible issues that can cause this. The most common cause is low voltage in the electrical system. This is due to a failing alternator or a failing battery. It can also be caused by a bad connection at the negative battery cable.

when a car goes into fail safe or limp mode it is caused by an important sensor the car needs to either run the motor or shift the trans..ikt then runs or operates on the driving info that the ecu has stored to be able to get it home or to a shop..youj will need to have a diagnostics ran on it and have the cars computer read to retrieve the code to identify the problem and once the problem component is replaced the car will automatically return to normal operation
