Changing groundwater levels are causing problems in many cities and urban areas throughout the world. Over-abstraction of water for prolonged periods has caused levels to fall with ensuing foundation settlement and structural damage caused by consolidation of the underlying strata, in addition to frequent deterioration of water quality. Conversely, the decline of industry in many cities and/or the provision of better piped supplies has led to greatly reduced water abstraction.

Urbanization has profound impacts on the hydrological cycle. These include radical, but not easily measured, changes in groundwater recharge, with modification to existing recharge mechanisms and the introduction of new ones. An analysis of factors controlling the infiltration process and potential groundwater recharge rates is given, and discussed through the results of five field surveys.

Groundwater control in urban areas - Designing Buildings Wiki - Share your construction industry knowledge. Excavation works for underground infrastructure such as deep basements or tunnels often encounter groundwater. Working below groundwater level can be difficult, as the excavation is at risk of instability and inundation.

In this research, the hydrogeological conditions in the central area of Madinah city, Saudi Arabia, were investigated in an attempt to gain insight into the shallow groundwater table rise problem that has recently been observed in this important location.

Groundwater Control in Urban Areas Groundwater poses a number of challenges to underground infrastructure projects. Dewatering Specialist Dr Martin Preene, speaker at a forthcoming BGA event on this topic, discusses some the challenges and potential solutions used by civil engineers when working below groundwater level.

There is also misuse of natural resources whose immediate compensation becomes difficult. Few acute problems of urban areas are scarcity of drinking water especially the ground water, scarcity of forest products, power cut due to excessive use of electricity etc. 4. Non-availability of open space:

Microbiological contamination is a widespread problem in urban areas and particularly affects shallow groundwater points. Growth in water demand, especially for agriculture and hydropower. Groundwater quality can also be threatened by intense rainfall events, resulting in flooding, which is becoming more common because of climate change.

Hydrogeology of Zambia - Earthwise

Rising groundwater levels have occurred in Riyadh despite the fact that it is situated in an arid area. A number of causes have been identified associated with high water usage, including losses from water main, leaking storage and septic tanks and irrigation. Poor natural drainage through the aquifer system prevents the high losses from draining deeper within the aquifer.

Today, the most common urban groundwater issues concern groundwater pollution from urban and industrial sources and recharge management, mainly in the context of rising water levels. As a science, urban hydrogeology is relatively young. Issues are complex and much remains to be done.

Urban Groundwater Issues—An Introduction | SpringerLink

Urban areas have the potential to pollute water in many ways. Runoff from streets carries oil, rubber, heavy metals, and other contaminants from automobiles. Untreated or poorly treated sewage can be low in dissolved oxygen and high in pollutants such as fecal coliform bacteria, nitrates, phosphorus, chemicals, and other bacteria.

The rapid growth of urban area has two basic effects on groundwater resources such as: effects on natural recharge of aquifers due to sealing of ground with concrete and pollution of groundwater due to leakage from drainage and, industrial wastage and effluents (Baier, Schmitz, Azzam, & Strohschon, 2014).

Contamination and over-extraction are compounding problems, as over-exploitation causes a higher concentration of pollutants in groundwater resources. Regions with stressed aquifers are generally more susceptible to water quality problems.

India's Groundwater Crisis: The Consequences of ...

Groundwater is a highly useful and often abundant resource. However, over-use, over-abstraction or overdraft, can cause major problems to human users and to the environment. The most evident problem (as far as human groundwater use is concerned) is a lowering of the water table beyond the reach of existing wells.
