variety of care settings in which APNs are practicing. The book is particularly timely and relevant because it appropriately places infection prevention solidly within the larger patient safety movement and affirms that preventing infections is everybody's concern. In acute care settings, for example, infection control has occasionally been relegated to the infection prevention specialist (e.g., infection control nurse or hospital epidemiologist) or the infection control committee. This has shown to be ineffective in any setting. It is those who "touch" the patients and oversee their care who must assume the responsibility for preventing untoward events such as infections. While not all infections are preventable, there is indeed room for improvement. This comprehensive reference is a first and essential step in that direction!" This in-depth reference presents a comprehensive approach to developing a facility-based infection prevention program, including numerous practical tips and clinical advice for successful implementation. Topics addressed include: Regulatory requirements Comprehensive infection prevention risk assessment and program development Surveillance and reporting Nursing assessment and interventions to prevent the most commonly occurring infections in long-term care Environmental cleaning and disinfection Unique long-term care issues such as care transitions and life enrichment activities Occupational health, immunization programs, and staff education Disaster and pandemic preparedness And more Appropriate for all types of long-term care facilities and includes a CD-ROM with customizable forms, helpful tools, and additional resources specific to infection prevention and control.

These guidelines provide recommendations that outline the critical aspects of infection prevention and control. The recommendations were developed using the best available evidence and consensus methods by the Infection Control Steering Committee. They have been prioritised as key areas to prevent and control infection in a healthcare facility. It is recognised that the level of risk may differ according to the different types of facility and therefore some recommendations should be justified by risk assessment. When implementing these recommendations all healthcare facilities need to consider the risk of transmission of infection and implement according to their specific setting and circumstances.

This volume offers extensive information on preventive and infection surveillance procedures, routines and policies adapted to the optimal infection control level needed to tackle today's microbes in hospital practice. It especially focuses on preventive measures for serious hospital infections. Each chapter includes a practical section that addresses the main aspects of procedures and treatment, and a theoretical section that contains updated documentation that can be used for further study, or to help select infection control measures. directly or indirectly with patients; in diagnosis, treatment, isolation measures, operations, equipment, drugs, cleaning, textiles, transport, porter service, food and water, building and maintenance, etc. Hygiene and environmental control is central to infection prevention for patients, visitors and staff alike. Good hygienic practices, individual infection control, well implemented and frequent environmental cleaning, and a high professional standard of hygiene in the treatment and care of patients, are essential to patient safety and a safe working environment. Addressing this essential topic, this book is intended for doctors, nurses and other healthcare workers, students in health-related subjects, hospital managers and health bureaucrats, as well as patients and their families.
