Seaweed Resources In Europe Uses And Potential Two main uses were identi fi ed: human Page 17/50

consumption and agriculture (cattle food and soil enrichment). Archaeologists and ethnologists have mentioned other uses such as fuel, mattresses, etc. The first recorded commercial use of seaweed is in the 17thcentury when it was used for the production of glass (France, Norway).

SEAWEED INDUSTRY IN EUROPE The report calls for development, improvement and diversification of seaweed aquaculture practices in Europe. With the world's population set to hit 9 billion before 2050, seaweeds can provide an alternative source of food, feed, fuel and livelihood for an ever-expanding population, if produced Page 19/50

The text covers research on food factors of a variety of physiological significance. The actual goal is to establish a role of food factors in disease prevention and health promotion from the scientific base. The two volumes present research data and reviews by numerous experts and should be of

special interest and relevance to all who are concerned with food factors in disease prevention and health promotion. Topics covered include: cancer prevention and those in antioxidants as well as vitamin E. minerals and trace elements, peptide and amino acids, flavones and flavonols, isoflavones, dietary fibers, oligo and

polysaccharides, lipids, catechins, tential carotenoids, polyphenols, terpenoids, and sulfur-containing compounds.

Seaweed is used in many countries for very different purposes - directly as food, especially in sushi, as a source of phycocolloids, extraction of compounds

Page 35/50

with antiviral, antibacterial or antitumor activity and as biofertilizers. About four million tons of seaweed are harvested annually worldwide. Of the various species known, less than 20 account for 90% of the biomass exploited commercially. This book details 147 species of edible seaweed, including scientific name and respective Page 36/50

common names, geographic location, tial nutritional composition, uses and is extensively illustrated.

Increasing amounts of various types of wastes and pollutants including nutrients

Page 37/50

enter the coastal waters via rivers, direct discharges from land drainage systems, diffuse land runoff, dumping and via the atmosphere. This has led to coastal eutrophication and in extreme cases to hypertrophication. Until recently, coastal eutrophication and the resulting effects on marine macrophytes were mainly treated as

local short-term problems. However, the local nearshore problems developed into overall coastal and inshore phenomena, and recently we have been facing coastal eutrophication problems on a global scale. This book is the first comprehensive document, systematically covering the entire coastline of Europe, on the effects of Page 39/50

eutrophication on the marine benthic tial vegetation.

The main effects of Seaweed extracts (Ascophyllum, Fucus, Sargassum, Saccorhiza, Laminaria, Gelidium and others), when used as agricultural fertilizers, are better seed germination and higher Page 40/50

quality fruit production, with longer shelf life; better use of soil nutrients; more productive crops and plants with greater resistance to unfavorable environmental conditions. Algae also have a long history of use as animal feed. They have a highly variable composition depending on the species, collection season and habitat, and

on external conditions such as water not a temperature, light intensity and nutrient concentration in water. In relation to ruminal fermentation, a high variability of the digestibility values was found among seaweed species and cannot be attributed only to the composition of different nutrients of the algae. The role of Page 42/50

marine algae for reduction of methane production is discussed with particular emphasis on novel algae-based feed strategies that target minimal methane emissions without affecting the functionality of the microbiota and overall animal productivity. Key Features: Sustainable Agriculture Natural Feeding Nutrients

Liquid Seaweed Agricultural Biostimulants
Natural Pesticides

This book is open access under a CC BY 4.0 license. This volume addresses the potential for combining large-scale marine aquaculture of macroalgae, molluscs, crustaceans, and finfish, with offshore

structures, primarily those associated with energy production, such as wind turbines and oil-drilling platforms. The volume offers a comprehensive overview and includes chapters on policy, science, engineering, and economic aspects to make this concept a reality. The compilation of chapters authored by internationally recognized Page 45/50

researchers across the globe addresses the theoretical and practical aspects of multi-use, and presents case studies of research, development, and demonstration-scale installations in the US and EU.

A comprehensive reference on all aspects of the isolation and cultivation of marine and Page 46/50

Industrial Applications of Marine Biopolymers presents different classes of marine biopolymers and their industrial applications, demonstrating the precious Page 47/50

value of ocean resources to society. This timely volume discusses the exceedingly useful polymers derived from these materials that are biodegradable, biocompatible, and at times water soluble. Direct use or chemically modified forms of such biomaterials have many chemical sites, making them suitable for varied types of Page 48/50

industrial applications. In addition, this book also addresses current global challenges of conservation, including extended drought conditions and the need for improved agricultural methods, together with new bio-medical developments. It is suitable for anyone who has an interest in the industrial applications of biopolymers.
