A New York Times Bestseller The leading thinker and most visible public advocate of modern monetary theory -- the freshest and most important idea about economics in decades -- delivers a radically different, bold, new understanding for how to build a

just and prosperous society. Stephanie Kelton's brilliant exploration of modern monetary theory (MMT) dramatically changes our understanding of how we can best deal with crucial issues ranging from poverty and inequality to creating jobs, expanding health care coverage, climate change, and building resilient infrastructure. Any ambitious proposal, however, inevitably runs into the buzz saw of how to find the money to pay for it, rooted in myths about deficits that are hobbling us as a country. Kelton busts through the myths that prevent us from taking action: that the federal government should budget like a household, that deficits will harm the next generation, crowd out private investment, and undermine long-term growth, and that entitlements are propelling us toward a grave fiscal crisis. MMT, as Kelton shows, shifts the terrain from narrow budgetary questions to one of broader economic and social benefits. With its important new ways of understanding money, taxes, and the critical role of deficit spending, MMT redefines how to responsibly use our resources so that we can maximize our potential as a society. MMT gives us the power to imagine a new politics and a new economy and move from a narrative of scarcity to one of opportunity.

The hope and hype about African digital entrepreneurship, contrasted with the reality on the ground in local ecosystems. In recent years, Africa has seen a digital entrepreneurship boom, with hundreds of millions of dollars poured into tech cities, entrepreneurship trainings, coworking spaces, innovation prizes, and investment funds. Politicians and technologists have offered Silicon Valley-influenced narratives of boundless opportunity and exponential growth, in which internet-enabled entrepreneurship allows Africa to "leapfrog" developmental stages to take a leading role in the digital revolution. This book contrasts these aspirations with empirical research about what is actually happening on the ground. The authors find that although the digital revolution has empowered local entrepreneurs, it does not untether local economies from the continent's structural legacies.

Who really creates wealth in our world? And how do we decide the value of what they do? At the heart of today's financial and economic crisis is a problem hiding in plain sight. In modern capitalism, value-extraction - the siphoning off of profits, from shareholders' dividends to bankers' bonuses - is rewarded more highly than value-creation: the productive process that drives a healthy economy and society. We misidentify takers as makers, and have lost sight of what value really means. Once a central plank of economic thought, this concept of value - what it is, why it matters to us - is simply no longer discussed. Yet, argues Mariana Mazzucato in this penetrating and passionate new book, if we are to reform capitalism - to radically transform an increasingly sick system rather than continue feeding it - we urgently need to rethink where wealth comes from. Who is creating it, who is extracting it, and who is destroying it? Answers to these questions are key if we want to replace the current parasitic system with a type of capitalism that is more sustainable, more symbiotic: that works for us all. *The Value of Everything* will reignite a long-needed debate about the kind of world we really want to live in.

Argues "that social scientists, governments and citizens need now to re-engage with the political dimensions of financial markets." - cover.

Endocrine surgery - the subspecialty of general surgery involving diseases of the thyroid, parathyroid, and adrenal glands as well as the endocrine pancreas - is a rapidly growing field of medicine that has a rich and fascinating history. As recently as the mid-19th Century, surgery for thyroid goiter was described as "horrid butchery" and believed by many to be too dangerous for any surgeon to attempt. Through the ingenuity and tireless efforts of surgeons in Europe and the U.S., thyroidectomy became a safe and even elegant operation, one that renowned Johns Hopkins surgeon William Halsted would describe in 1926 as representing "the supreme triumph of the surgeon's art." In this unique and captivating book, these and other seminal stories from the history of endocrine surgery are vividly retold by the current leaders in the field.

This anthology provides insight and observations on the importance of the Eurasia region, including Russia and other countries of the former USSR. The articles that make up this work provide a detailed description of regional realities, including a contextual discussion of the current Ukraine situation, viewed through the prism of Russia's traditional military-strategic culture. As with all countries in the Eurasian region, Russia's traditional strategic interests play a critical role in the geopolitical and socio-cultural situation in that region. The anthology was created for the Army University Press, but goes beyond the obvious military strategic nexus and seeks to identify new spaces for consideration by planners and policymakers alike.

This chapter discusses various past and future aspects of the global economy. There has been a huge transformation of the global economy in the last several years. Articles on the future of energy in the global economy by Jeffrey Ball and on measuring inequality by Jonathan Ostry and Andrew Berg are also illustrated. Since the 2008 global crisis, global economists must change the way they look at the world.

Vaccinology, the concept of a science ranging from the study of immunology to the development and distribution of vaccines, was a word invented by Jonas Salk. This book covers the history of the methodological progress in vaccine development and to the social and ethical issues raised by vaccination. Chapters include "Jenner and the Vaccination against Smallpox," "Viral Vaccines," and "Ethical and Social Aspects of vaccines." Contributing authors include pioneers in the field, such as Samuel L. Katz and Hilary Koprowski. This history of vaccines is relatively short and many of its protagonists are still alive. This book was written by some of the chief actors in the drama whose subject matter is the conquest of epidemic disease.

The book explores the central question facing humanity today: how can we best survive the ten great existential challenges that are now coming together to confront us? Besides describing these challenges from the latest scientific perspectives, it also outlines and integrates the solutions, both at global and individual level and concludes optimistically. This book brings together in one easy-to-read work the principal issues facing humanity. It is written for the two next generations who will have to deal with the compounding risks they inherit, and which flow from overpopulation, resource pressures and human nature. The author examines ten intersecting areas of activity (mass extinction, resource depletion, WMD, climate change, universal toxicity, food crises, population and urban expansion, pandemic disease, dangerous new technologies and self-delusion) which pose manifest risks to civilization and, potentially, to our species' long-term future. This isn't a book just about problems. It

is also about solutions. Every chapter concludes with clear conclusions and consensus advice on what needs to be done at global level—but it also empowers individuals with what they can do for themselves to make a difference. Unlike other books, it offers integrated solutions across the areas of greatest risk. It explains why *Homo sapiens* is no longer an appropriate name for our species, and what should be done about it.
